Need for a method

Objective: Define an organized method to manage the migration/reorg of Venmo' workloads.

Constraints: As regulated industry, we need to find an auditable with controls (safe and quality), top-down and structured method, evolvable with living documentation (traceability), AI-based and easy to maintain.

Spec-Driven Dev

Evolution of BDD and TDD

3 approaches:

- Spec-First
- Spec-Anchored
- Spec-as-source.

Differences due to modifications on initial specifications and code.
Structured similar: Memory bank, specs, features/tasks

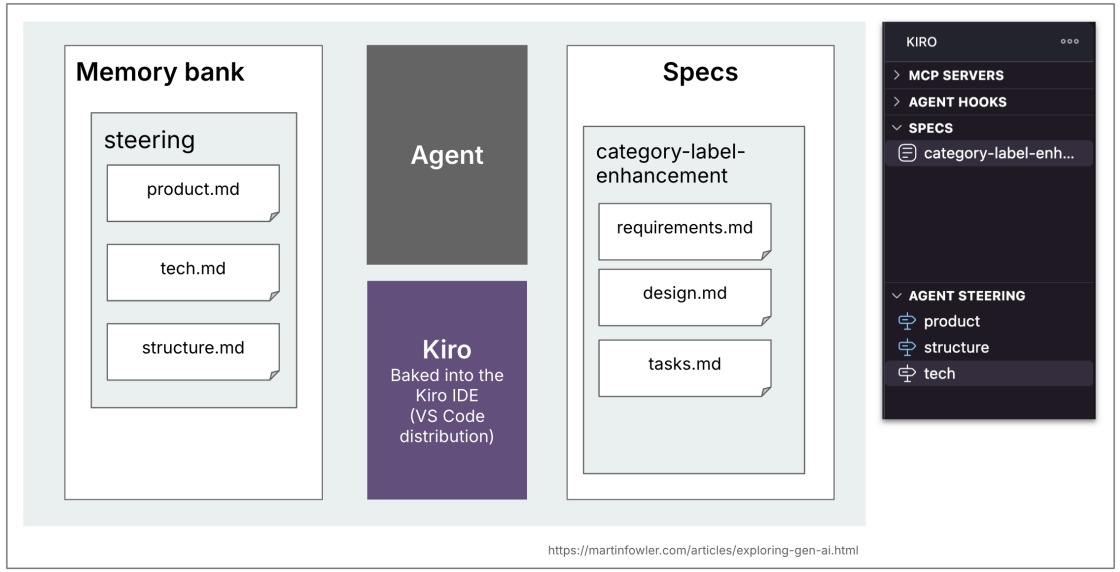
- **Toolset**

Kiro



Kiro:

AI IDE with focus on Spec-Driven Dev, but support bug fixing
AWS managed and charge LLM.
AWS Support and Training
Simple

Kiro on Claude Code

Kiro on Claude Code:

VSCode Extension
Need a Claude Code API Keys
Bypass Security to act as agent
Create more under-the-hood files (.claude/agents)

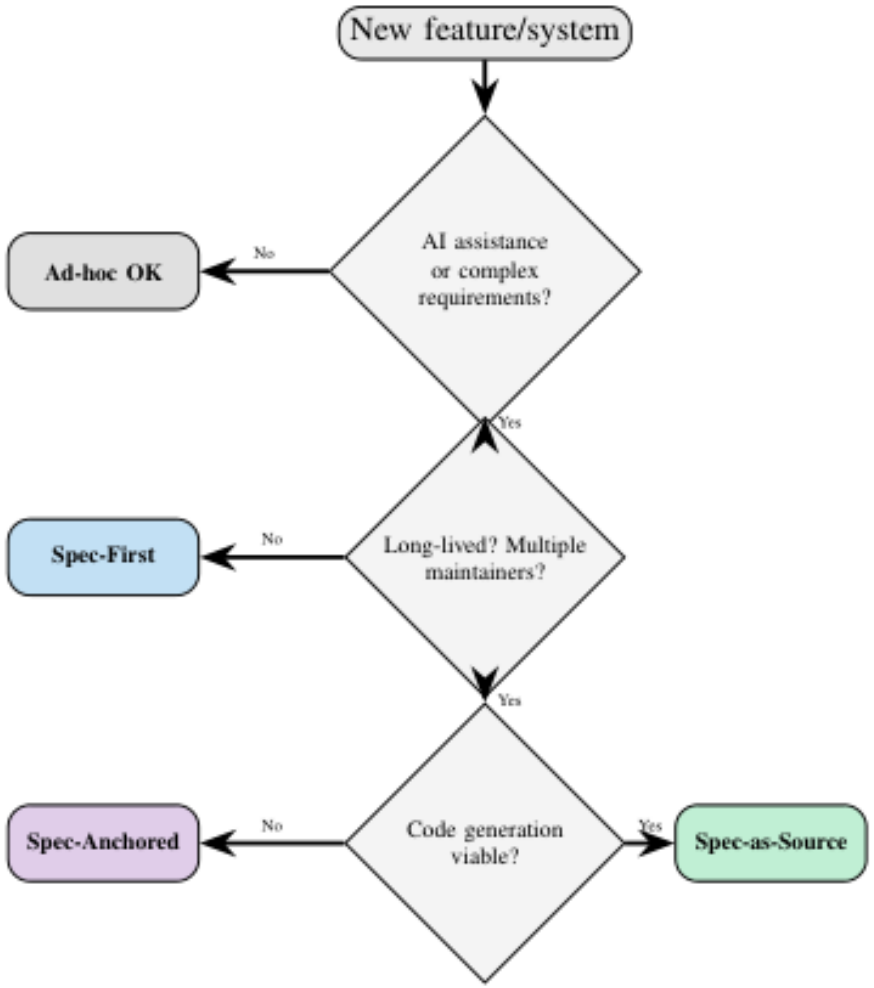
Conclusions/Learned Lessons



- Follow a method to scale on a team and choose the right approach based on team' maturity and maintainability.
- Need of a orchestrator (stages and transversal policies) between projects (Pipeline).
- Difference between steering and structured files (design, requirements, tasks)
- Allow optional tasks for testing (Validation tasks are longer) or using external tools.
- Modifications has to be saved on documents or on steering to have single source of truth, otherwise you can save interactions on Export Conversations.
- Cost is based on the complexity and tier. A different control on Kiro (AWS Account) and Claude Code (Solvd API Control)
